Executive Summary

This noise monitoring report is drafted for the period April - June 2021. This report consists of three parts: introduction to this report, general statistics related to the operations at Dublin Airport, and noise monitoring statistics per noise terminal. This executive summary briefly lists numbers related to the noise performance of Dublin Airport, these can be found in Table 1 and Table 2. In Table 1 the number of events from noise monitoring terminals (NMTs) which are directly overflown are listed. These events are correlated aircraft noise events, they are coupled with a specific arriving or departing aircraft overflying the NMT. Table 2 shows in summary the average measured noise levels for the second quarter period of 2021 for all operational NMTs. As one may expect, NMTs frequently overflown (NMTs 1, 2, and 20) measure higher noise levels which are attributed to aircraft, in comparison to the other NMTs.

Figure 1: Runway Layout Dublin Airport

NMT	Number of correlated aircraft noise events			
	Description	Arrivals	Departures	Total
1	Arrivals Runway 10, Departures Runway 28	1,144	3,930	5,074
2	Arrivals Runway 28, Departures Runway 10	4,407	1,017	5,424
5	Arrivals Runway 16, Departures Runway 34	29	17	46
6	Arrivals Runway 34, Departures Runway 16	23	20	43
20	Arrivals Runway 28, Departures Runway 10	4,085	770	4,855

Table 1: Correlated aircraft noise events

NMT	Daytime noise level, LAeq, 16 h[dB]		Nighttime noise level, LAeq, 8 h[dB]	
	Total	Aircraft	Total	Aircraft
1	58.4	54.8	56.3	53.3
2	55.1	52.8	53.7	51.8
3	59.0	46.9	51.6	40.9
4	53.7	37.1	47.8	29.2
5	51.8	38.2	48.5	34.1
6	52.4	38.4	48.3	36.4
20	61.2	51.0	54.8	49.8

Table 2: Average measured noise levels

Introduction

This quarterly report, commissioned by Dublin Airport, presents a summary of the noise performance near Dublin Airport, for the period from April 1st to June 30th 2021.

To monitor aircraft noise levels and flight tracks near Dublin Airport, a Noise and Flight Track Monitoring System (NFTMS) is in place. This system, by Envirosuite, is composed of a feed from Air Traffic Control radar to capture the aircraft, and a series of Noise Monitoring Terminals (NMTs) which are installed in the area around the airport. In total, seven NMTs are in place:

- Bay Lane: (NMT 1: monitoring runway 28 departures and runway 10 arrivals)
- St. Doolaghs: (NMT 2: monitoring runway 10 departures and runway 28 arrivals)
- Bishopswood: (NMT 3: monitoring local area)
- Feltrim: (NMT 4: monitoring local area)
- Balcultry: (NMT 5: monitoring runway 34 departures and runway 16 arrivals)
- Artane: (NMT 6: monitoring runway 16 departures and runway 34 arrivals)
- Coast Road: (NMT 20: monitoring runway 10 departures and runway 28 arrivals)

This report presents the results of the measurements in the period from the start of April to the end of June 2021 for all NMT locations. The NMT locations are shown in Figure 2. General statistics of flight operations of Dublin Airport in the second quarter of 2021 are provided in the General Statistics section. Results specific to the measurements obtained at the various monitoring stations are presented in the Noise Monitoring Statistics section.

Figure 2: Noise Monitoring Terminal locations

General Statistics

Traffic

In the Second quarter of 2021, Dublin Airport handled a total of 11,772 flights and 599,129 passengers. This is an increase of 70% in traffic and an increase of 258% in passenger numbers compared to the same period in 2020. Note that the number of movements includes both departures and arrivals. Figure 3, gives an hourly distribution of the movements for the Second three months of 2021, compared to the hourly distribution of the same period in 2020.

Figure 3: Hourly distribution of movements from April - June 2020 vs 2021

A wide variety of aircraft operate from Dublin Airport ranging from turboprop aircraft such as the ATR and Dash-8 to wide body jets like Boeing 777. However, the majority of movements were performed using medium sized jets, with the Boeing 737 and Airbus A320 series aircraft accounting for more than 49% of the total. Figure 4 provides a more detailed overview of aircraft types. The aircraft types are divided into the categories: A/B and C/D. Table 3 on the next page list typical aircraft types belonging to these categories.

Figure 4: Aircraft type distribution April - June 2020 vs 2021

Aircraft category	Aircraft type:
A/B	Propellor aircraft
	Turboprop aircraft
	Whisper jets (aircraft like BAe-146 and Avro-Jet)
	Mostly small general aviation aircraft powered by piston engines
C/D	Airbus
	Boeing
	Bombardier Canadair Regional Jet (CRJ) - Series
	Business jets
	Embraer

Table 3: Aircraft type classification

Track Adherence

There are four environmental corridors at Dublin airport, one for every runway direction. For both the Second quarter of 2020 and 2021, 97% of category C/D aircraft stayed within these corridors. Category A/B aircraft may operate outside these.

Runway use and weather

Figure 5 shows that Runway 28, the runway for aircraft landing and departing in the westerly direction, handled 77% of all movements in the period April to June 2021 versus 66% in 2020. Runway 10, the runway for aircraft landing and departing in the easterly direction, was 20% of the movements in the period April to June 2021 versus only 31% in 2020. The remaining percentage of the movements in 2020 and 2021 took place on the cross runway 16/34.

Figure 5: Runway usage, April - June 2020 vs 2021

Overflying height analysis

The measured sound levels depend on the height at which the NMT is overflown. Generally, higher overflying altitudes result in lower recorded sound levels. For NMT's, which are directly overflown, the average overflying height is shown in Table 4 below for the Second quarter of 2020 and 2021. In which A and D stands for arrivals and departures respectively.

NMTs	Height (ft)			
	2020		2021	
	A	D	A	D
NMT1	900	2,700	800	2,500
NMT2	1,000	2,900	900	2,700
NMT3	800	2,700	700	2,600
NMT4	1,100	3,200	1,100	3,100
NMT5	1,400	2,600	1,100	3,300
NMT6	1,100	3,100	1,100	2,800
NMT20	1,500	3,500	1,500	3,600

Table 4: Average overflight height

Noise Monitoring Statistics

Reading guide

The noise values presented in this report are values based on measurements, these values will differ from noise contours produced by computer modelling and are not directly comparable. Noise contours produced by computer modelling are typically based on an average summer or annual day and include all aircraft movements rather than those which produce correlated noise events.

The measured noise values are obtained from Noise Monitoring Terminals (NMTs). An upgraded Noise and Flight Track Monitoring System (NFTMS) with all new NMTs, provided by Envirosuite, has been commissioned by DAA as of 2017 to monitor the noise performance of Dublin Airport. This system subject to a further upgrade in Q1 2021 and further upgrades and expansions of the system are being considered.

These NMTs are set to record continuously and to trigger a noise event when two conditions are met. The Second condition is the threshold level. The threshold level needs to be exceeded before recording is initiated. The threshold levels are continuously adjusted by Envirosuite to ensure maximum correlation between noise and individual operations. The second condition is the length of the recorded noise events. The recorded noise events should last for at least 10 seconds. Due to its proximity to agricultural, roads, and/or urban areas, NMTs can be triggered not just by aviation noise. It is for this reason the system is designed to correlate a noise event with an aircraft departing or landing Similarly, the system can detect when the noise originates from a weather event, such as thunder or other stormy conditions.

Noise measurements are classified in three categories: aircraft, community, and weather. The community category, or normal human activity, includes all noise events that are not categorized as aircraft or weather. The measurement of total noise includes all three noise categories.

Noise levels calculation methodology

The noise monitoring system logs, per correlated aircraft event, the duration and measures the noise level of the event, which is later converted to LAeq, 1hour. This is the sound level, in decibels, equivalent to the total A-weighted sound energy of one hour. Average noise levels, for a reference duration, are derived from LAeq, 1 hour. The four noise levels are used in this report are:

- LAeq, 16 h, average daytime noise levels: - The LAeq, 16 h is determined by averaging the aircraft noise levels per month between 07:00 and 23:00, hence 16 hours.
- LAeq, 8 h, average nighttime noise levels: - The LAeq, 8 h is determined by averaging the aircraft noise levels per month between 23:00 and 07:00, hence 8-hour equivalent.
- LAeq, average hourly noise levels: - Same methodology applies for LAeq, compared to LAeq, 16 h and LAeq, 8 h, instead an average is taken per hour over a half year period instead of per month.
- LAmax: - LAmax indicates the maximum recorded noise level per correlated aircraft-noise event, while the average noise levels indicate the average noise levels for a reference duration.
- LAmax distribution: This distribution is determined by determining the number of occurrences per 3 dB bracket, since every 3 dB increase is a doubling in sound level.

Average NMT figures

The following graphs presented below display an Average value measured per NMT between the reporting period from April 1st up to and including June 30th, 2021. The categories are as followed:

Average monthly LAmax noise levels per NMTs are shown in Figure 6

Figure 6: Average LAmax levels distribution for NMTs, April - June 2021

Average monthly LAmax noise levels per NMT for departing and arriving aircraft.

Figure 7: Average LAmax levels distribution for NMTs for arriving and departing aircraft, April - June 2021

Figure 8 presents the average noise levels measured at by all the NMTs for this reporting period during daytime which is defined as 07:00 in the morning to 22:59 in the evening. This procedure is followed both for all noise events, and for those events that were correlated to aircraft movements. The results shown are presented per NMT.

Figure 8: Averaged daytime noise levels per NMTs, April - June 2021

Noise levels during the night are determined using a similar method as described above. The night period is defined as a period between 23:00 in the evening to 06:59 in the morning. Noise levels are therefore averaged over an 8-hour window. Figure 9 presents these results per NMT.

Figure 9: Averaged nighttime noise levels per NMTs, April - June 2021

NMT 1: Bay Lane

Noise Monitoring Terminal 1 ('Bay Lane') is located west of Dublin Airport, see Figure 10 below, under the extended runway centreline of runway 28. Its purpose is to monitor runway 28 departures and runway 10 arrivals. The resulting data for NMT 1 measurements in the period from April 1st up to and including June 30th, 2021 are presented in this section.

Figure 10: Noise Monitoring Terminal Bay Lane Location

Noise Events

The figure below shows the breakdown of noise events attributed to aircraft, weather, and the community.

Figure 11: NMT 1 Noise Event Types

NMT Operational Status

To ensure that Noise Monitoring Terminals keep working within specific limits, internal calibration checks are completed every 6 hours. Outside of the 6 hourly calibration checks, NMTs will require maintenance and during this time will not record noise events. The operational status of NMT 1: Bay Lane is presented in Figure 12.

Figure 12: Operational status of NMT1, April - June 2021

Noise Levels

Figure 13 presents the average noise levels measured at NMT 1 during daytime periods, which are defined to be from 07:00 in the morning to 22:59 in the evening. Recorded noise levels during these time segments are therefore averaged over a 16-hour window.

This procedure is followed both for all noise events, and for those events that were correlated to aircraft movements. The results shown are presented monthly.

Figure 13: Averaged daytime noise levels for NMT 1, April - June 2021

Noise levels during the night are determined using a similar method as mentioned above. The night period is defined as a period between 23:00 in the evening to 06:59 in the morning. Noise levels are therefore averaged over an 8-hour window. Figure 14 presents these results monthly.

Figure 14: Averaged nighttime noise levels for NMT 1, April - June 2021

The hourly noise distribution at NMT 1 as shown in Figure 15.

Figure 15: Averaged hourly noise levels for NMT 1, April - June 2021

Figure 16 shows the LMax distribution for aircraft noise for the Second quarter of 2021 for NMT1.

Figure 16: LMax levels distribution for NMT 1, April - June 2021

Table 5 shows the top 10 loudest correlated aircraft types from the total count of correlated noise events to NMT1.

Aircraft Type	Max dB	Total Count
B744	85.7	2
C130	85.2	1
P180	84.9	1
B772	82.5	2

A333	79.3	307

Table 5: LAmax by aircraft types correlated to NMT1, April - June 2021

NMT 2: St. Doolaghs

Noise Monitoring Terminal 2 ('St. Doolaghs') is located east of Dublin Airport, see Figure 17 below, under the extended runway centreline of runway 10. Its purpose is to monitor runway 10 departures and runway 28 arrivals. The resulting data for NMT 2 measurements in the period from April 1st up to and including June 30th, 2021 are presented in this section.

Noise Events

The figure below shows the breakdown of noise events attributed to aircraft, weather, and the community.

Figure 18: NMT 2 Noise Events Types

NMT Operational Status

To ensure that Noise Monitoring Terminals keep working within specific limits, internal calibration checks are completed every 6 hours. Outside of the 6 hourly calibration checks, NMTs will require maintenance and during this time will not record noise events. The operational status of NMT 2: St. Doolaghs is presented in Figure 19.

Figure 19: Operational status of NMT 2, April - June 2021

Noise Levels

Figure 20 presents the average noise levels measured at NMT 2 during daytime periods, which are defined to be from 07:00 in the morning to 22:59 in the evening. Recorded noise levels during these time segments are therefore averaged over a 16-hour window.

This procedure is followed both for all noise events, and for those events that were correlated to aircraft movements. The results shown are presented monthly.

Figure 20: Averaged daytime noise levels for NMT 2, April - June 2021

Noise levels during the night are determined using a similar method. The night period is defined as a period between 23:00 in the evening to 06:59 in the morning. Noise levels are therefore averaged over an 8-hour window. Figure 21 presents these results monthly.

Figure 21: Averaged nighttime noise levels for NMT 2, April - June 2021

The hourly noise distribution at NMT 2 as shown in Figure 22.

NMT 3: Bishopswood

Noise Monitoring Terminal 3 ('Bishopswood') is located west of Dublin Airport and north of flightpath for runway 10/28, see Figure 20 below. Its purpose is to monitor aircraft noise levels in the local area. The resulting data for NMT 3 measurements in the period from April 1st up to and including June 30th, 2021 are presented in this section.

Figure 24: Noise Monitoring Terminal Bishopswood Location

Noise Events

The figure below shows the breakdown of noise events attributed to aircraft, weather, and the community.

NMT 5: Balcultry

Noise Monitoring Terminal 5 ('Balcultry') is located northwest of Dublin Airport, see Figure 38 below, under the extended runway centreline of runway 34. Its purpose is to monitor runway 34 departures and runway 16 arrivals. The resulting data for NMT 5 measurements in the period from April 1st up to and including June 30th, 2021 are presented in this section.

Figure 38: Noise Monitoring Terminal Balcultry Location

Noise Events

The figure below shows the breakdown of noise events attributed to aircraft, weather, and the community.

Figure 39: NMT 5 Noise Event Types

NMT Operational Status

To ensure that Noise Monitoring Terminals keep working within specific limits, internal calibration checks are completed every 6 hours. Outside of the 6 hourly calibration checks, NMTs will require maintenance and during this time will not record noise events. The operational status of NMT 5: Balcultry is presented in Figure 40.

Figure 40: Operational status of NMT 5, April - June 2021

Noise Levels

Figure 41 presents the average noise levels measured at NMT 5 during daytime periods, which are defined to be from 07:00 in the morning to 22:59 in the evening. Recorded noise levels during these time segments are therefore averaged over a 16-hour window.

This procedure is followed both for all noise events, and for those events that were correlated to aircraft movements. The results shown are presented monthly.

Figure 41: Averaged daytime noise levels for NMT 5, April - June 2021

Noise levels during the night are determined using a similar method. The night period is defined as a period between 23:00 in the evening to 06:59 in the morning. Noise levels are therefore averaged over an 8-hour window. Figure 42 presents these results monthly.

Noise Events

The figure below shows the breakdown of noise events attributed to aircraft, weather, and the community.

Figure 53: NMT 20 Noise Event Types

NMT Operational Status

To ensure that Noise Monitoring Terminals keep working within specific limits, internal calibration checks are completed every 6 hours. Outside of the 6 hourly calibration checks, NMTs will require maintenance and during this time will not record noise events. The operational status of NMT 20: Coast Road is presented in Figure 54.

Figure 54: Operational status of NMT 20, April - June 2021

Noise Levels

Figure 55 presents the average noise levels measured at NMT 20 during daytime periods, which are defined to be from 07:00 in the morning to 22:59 in the evening. Recorded noise levels during these time segments are therefore averaged over a 16-hour window.

This procedure is followed both for all noise events, and for those events that were correlated to aircraft movements. The results shown are presented monthly.

Figure 55: Averaged daytime noise levels for NMT 20, April - June 2021

Noise levels during the night are determined using a similar method. The night period is defined as a period between 23:00 in the evening to 06:59 in the morning. Noise levels are therefore averaged over an 8-hour window. Figure 56 presents these results monthly.

Figure 56: Averaged nighttime noise levels for NMT 20, April - June 2021

The hourly noise distribution at NMT 20 as shown in Figure 57.

Figure 57: Averaged hourly noise levels for NMT 20, April - June 2021

Figure 58 shows the LAmax distribution for aircraft noise for the Second quarter of 2021 for NMT 20.

Figure 58: LAmax levels distribution for NMT 20, April - June 2021

Table 11 shows the top 10 loudest correlated aircraft types from the total count of correlated noise events to NMT20.

Aircraft Type	Max dB	Total Count
C130	82	1
B744	79.3	2
S92	77	91
IL76	76.1	2
B77W	75.3	109
A333	74.5	325
B77L	74.5	75
B762	73.9	2
A306	73.7	193
GLF5	73.6	1

Table 11: LAmax by aircraft types correlated to NMT20, April - June 2021

Glossary

Symbol	Description	Unit
L _{Aeq}	A-weighted, equivalent noise level, averaged per hour over a half year period.	[dB]
L _{Aeq, 8 h}	A-weighted, equivalent noise level, averaged over eight hours per month between 23:00 and 07:00 (nighttime), hence 8 hour equivalent.	[dB]
L _{Aeq, 16 h}	A-weighted, equivalent noise level, averaged over 16 hours per month between 07:00 and 23:00 (daytime), hence 16 hour equivalent.	[dB]
L _{A,MAX}	A-weighted, maximum recorded noise level per correlated aircraft-noise event, instead of indicating the average noise levels for a reference duration.	[dB]
